

MULTIPOINT DONE RIGHT.

DC3's Modular Multipoint Mirador Solution

Traditional multipoint systems rely on a single pump that forces your wells or process streams into a treatment timeshare. These systems often fall short of the intended value they are designed to deliver across the life-cycle of an asset.

One chemically related well failure due to a traditional multipoint failure eliminates any savings on injection equipment; an unfortunate consequence bought with the economic allure of these complex injection systems.

DC3's solutions consider what is best for the entire life-cycle of your asset. We have implemented modular multipoint systems that deliver tank footprint savings and eliminate the risk associated with other products on the market.

You control chemical treating decisions, not your multipoint system.

Need to slide in a new chemistry for 2 of the 8 wells sharing a corrosion inhibitor tank? No problem with the Mirador Modular Multipoint.

Modular Multipoint with the Mirador enables your teams to make real time modifications and repairs to your chemical injection equipment without sacrificing treatment to other wells.

The power of having a person on-site 24/7 monitoring each injection point and pump is here. When you quantify the value of variance elimination, the difference is clear.

Contact DC3 today for more information about products and services.
